

**Dave Gohlke** is an Energy and Environmental Analyst at Argonne National Laboratory. His research examines costs, energy consumption, and carbon emissions for advanced vehicle technologies. Recent published research covers varied topics including: potential nationwide energy use by connected and automated vehicles, historical nationwide energy use by plug-in electric vehicles, powertrain downsizing for vehicle lightweighting, lifecycle analysis of emissions and costs of various vehicle powertrains, and benefit analysis of U.S. Department of Energy research programs.

Previously, he held a AAAS Science and Technology Policy Fellowship at the Vehicle Technologies Office in the U.S. Department of Energy. He has a doctorate in nanoscale physics from Ohio State University and an undergraduate degree in mathematics and physics from Youngstown State University.
