

# 600 curtailment events in 220 days.

## What's next?

---

Conrad Eustis  
March 12, 2019

Presented at:  
ACEEE Hot Water Forum

Portland General Electric is a fully integrated energy company based in Portland, Oregon serving approximately 885,000 residential, commercial and industrial customers in 51 cities.

## Quick facts about PGE

- 2,950 employees
- 47% of state's population
- 19.1 million MWh delivered
- Peak load: Dec. 21, 1998 4,073 MW
- Summer Peak 2017 3,972 MW
- No. 1 renewable power program in the nation with 200K participating customers
- Top ranking in JD Power 2017 Electric Utility Business Customer Satisfaction Study
- First multi-MW Li-ion battery-inverter system placed in operation by a US utility
- 2018 national award from EPRI for leadership and support in sustainability planning

### Diverse generation mix

16 major generation plants providing a cleaner energy future

# Addressing peak system demand

Peak system demand is that one hour, over several years, when simultaneous demand of commercial, residential and industrial loads reaches a maximum.

Peak is often hundreds of megawatts higher than a typical day.

# Demand response value proposition

- Conventional solution generation: the lowest cost power plant costs \$800/kW.
- 200 MW plant to meet peak demand costs ~\$160 million
- Tough to justify for something that's runs only a few hours per year.
- Choices:
  - Build plant
  - Short term solution in wholesale market?
  - Meet peak with demand response

# Why hot water heaters for DR?

- The cheapest demand response resource is usually from large industrial or commercial customers, if they're willing to be curtailed.
- But water heaters are make sizable contributions to both morning and afternoon peak loads—but economic?
- The Pacific NW study, and business case, creates a realistic solution to an economic, large resource
- The economic benefit in OR and WA has NPV of \$230.
- Resource size is 300 MW at 26% enrollment level
- U.S. potential is about 15 times this

**3.6 million water heaters in the PNW—most will get replaced over 15 years. A 1,400 MW/ 2,500 MWh resource opportunity. except.....**

# Challenge

**Existing DR technology is obsolete and not cost-effective. I call it crow-bar technology because it's requires a lot of dirty work and it is customer-unfriendly.**

# Barriers to residential DR at scale

## Customer perspective

1. Difficult customer experience
2. Concern about insufficient hot water
3. Small participation incentive

## Utility perspective

4. Too costly to connect one device

# How do we get past the barriers?

A close-up photograph of a person's hand holding a yellow USB drive, about to insert it into a white device's port. The background is a light, neutral color.

# Open Standards

- Why a socket
  - Cf. to PC serial port
- Open at the device
  - Cf. to USB
- Open to anyone
  - Cf. to smart phone

# ANSI/CTA-2045 to the rescue

- CTA-2045 is gaining momentum.
- Creates a consistent customer experience.
- Enables simple implementation for the provider.
- A standard creates volume for hardware.
  - Volume creates low cost.
- Solves three-out-of-four barriers.

# Catch-22

- Water heater manufacturers sell into a national market for customers, not utilities.
- Customers are not asking for “DR-enabled water heaters
- Utilities have sufficient benefit to cover the cost of implementing CTA-2045 on water heaters.
- However, one utility’s market share is too small to affect a manufacturer’s product plan.

# PGE has tried these approaches:

- Sought a legislative mandate
- Asked the DOE to identify a consensus standard
- S.1874 proposes a large, national demonstration
- Market transformation led by PNW

In progress

[www.bpa.gov/goto/smartwaterheaterreport](http://www.bpa.gov/goto/smartwaterheaterreport)

**NW regional pilot  
objective:  
Demonstrate market  
transformation is  
cost-effective**

# Vision:

## What does a transformed market look like?

- **ALL** electric water heaters (standard electric and heat pump) over 40 gallons shipped to the PNW have an open-source communication interface (CTA-2045).
- Enroll customers by sending communication device in mail.
- ENERGY STAR and the DOE recognize and promote ANSI/CTA-2045.
- Utilities and aggregators leverage DR capabilities of CTA-2045.
- New IoT models emerge in home.

# Participants

- **Project funding:** \$1 million BPA TI 336 (BPA labor & cost share not included)
- **Project leads:** Tony Koch, BPA and Conrad Eustis, PGE
- **Suppliers:** A.O. Smith, General Electric, e-Radio Inc.
- **Major support organizations:** NEEA (Geoff Wickes) and PNNL (Cheryn Metzger)

## Utility Participants:

Portland General Electric, Tacoma Power, Puget Sound Energy, Clark Public Utilities, Emerald PUD, Snohomish PUD, Springfield Utility Board, Franklin PUD

# Objectives

- 175 heat pump water heaters.
- 90 resistance water heaters
- 24x7 Control, 365 days/year
- Quantify
  - ❖ peak load mitigation
  - ❖ energy shifting
- Customer acceptance
- Regional education
- Market transformation plan
- Business case to justify market transformation plan

# Project uses smart water heaters

## “Smart”

- Electronic control
- Standard control language
- OEM enables DR response
- DR commands ignored to maintain sufficient hot water

## Low Cost only if:

- Standard Physical Socket (e.g. CTA-2045, USB, etc.)
- Standard format for data packets
- Standard initial exchange of information
- Does NOT depend on DR language

## “Smart” Status:

- Only 5 to 10% of tanks sold
- All have proprietary interfaces
- Ready; but need adapter

# Customer satisfaction

- 190 Participants completed survey
  - 10 Elec Resistance and 180 HPWH*
- Ran out of hot water last year?
  - *40% never*
  - *50% couple times*
- How satisfied were you with the Pilot?
  - *83% Very*
  - *15% Somewhat*
- Likely to participate in DR Program in the future?
  - *72% very likely*
  - *24% Somewhat likely*
- Primary Motivation to joining the study:
  - *38% Amount of incentive*
  - *46% knowing that I'm helping to avoid a new power plant*
  - *43% knowing that I could influence more clean renewable energy on the grid*
  - *26% Getting an annual report that quantify my contribution to the CO2 reduction*

# Peak demand reduction results

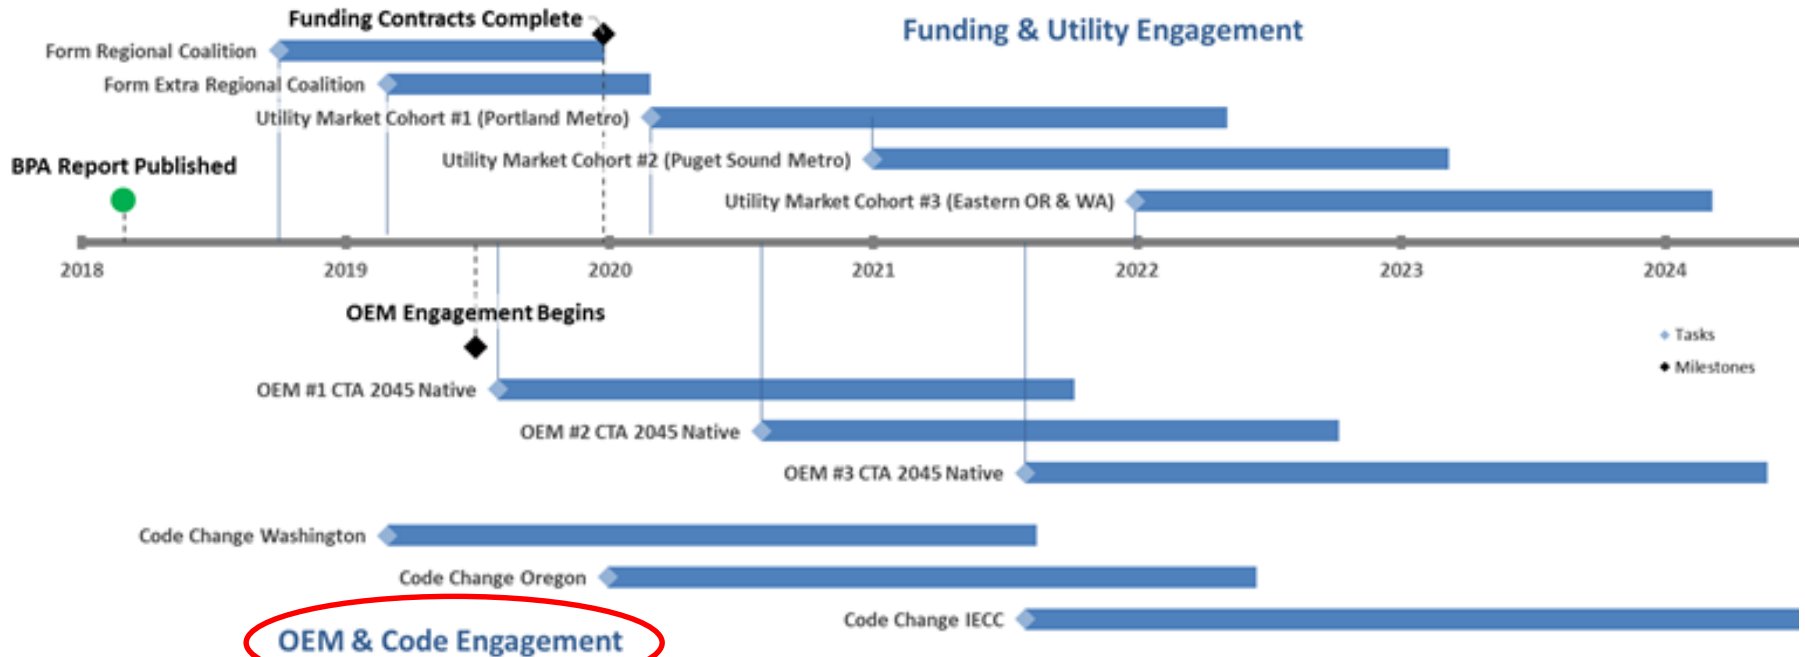

Winter Peak Results	3-Hour Shed Watts Reduction	95% CI
Heat Pump Water Heaters		
A.M. peak	223	±27
P.M. peak	165	±31
Resistive Water Heaters		
A.M. peak	374	±65
P.M. peak	321	±74

Summer Peak Results	4-Hour Shed Watt Reduction	95% CI
Heat Pump Water Heaters		
P.M. peak	85	±10
Resistive Water Heaters		
P.M. peak	347	±29

## Grid emergency results

Time	Winter/Spring Grid Emergency Watt Reduction	95% CI	Summer Grid Emergency Watt Reduction	95% CI
Heat Pump Water Heaters				
A.M. period	244	±32	122	±20
P.M. period	167	±43	96	±11
Resistive Water Heaters				
A.M. period	562	±69	393	±50
P.M. period	563	±105	389	±39

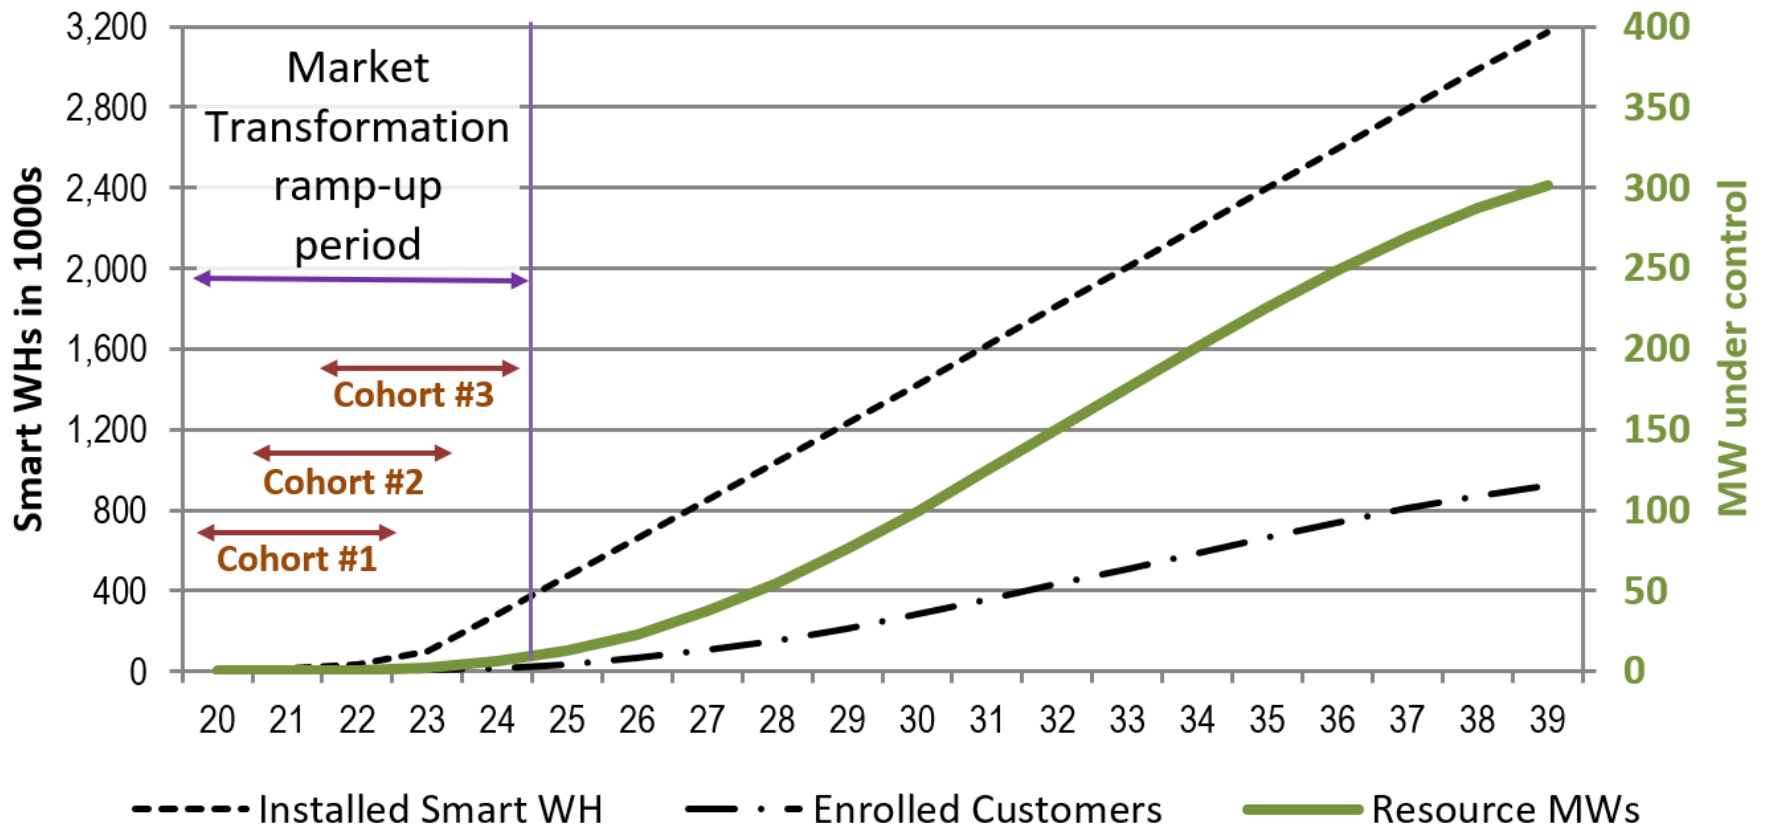

# Market transformation plan

How Soon?

# 301 MW by 2039 (@ 26.5% adoption)

## Aggregated Benefits of Market Transformation

# Business case results

<b>Public Share</b>	<b>33%</b>	<b>Mix of Public and IOU</b>			<b>26.5%</b>	<b>Regional Adoption</b>

# Not included: Soft benefits

- Use of thermal storage in tanks to shift load to greener generation reduces CO<sub>2</sub>. At \$50 per ton, it's worth about \$6 million/yr (900,000 water heaters @ 26.5% adoption.)
- Locational value
- Ancillary services: frequency regulation, load following, black start, spinning reserve, etc.
- Economic dispatch: A least-cost means to sink excess wind and solar generation

# What's Next

# Solution.....?

- Sell plan to utilities in 2019
- When sufficient commitment achieved, launch transformation with manufacturers
- Work to get state codes requirements, then national
- **Actively seeking interested utilities**

# Questions?

[Conrad.eustis@pgn.com](mailto:Conrad.eustis@pgn.com)

503 464 7016

# Advantages of a standard socket

- Enables any WAN, or LAN, or wired connection method
- Compared to embedded communication, doesn't incur energy or hardware cost until customer elects connected-operation... maybe never.
- Security issues solved in the communication device, not the appliance
- Volume lowers the cost of the communication device
- Cheap memory means communication device can have a "library" of device-specific knowledge
- [Remote] communication protocols can come and go, without ever affecting the functionality of an appliance with a 20-year life

# New concept

- For first 120 years
  - Energy flows one way to customer
  - Generation built with “obligation to serve”
- Renewables at scale everyone talks about battery storage, but flexible loads are cheaper!
- Need a better, richer word!

**Alonetic**, adjective

āl • ō • nēt • ĭk

**alo-** from the Latin “to support”

**net** as in the electric grid **net**work

**-ic** of, or **pertaining to**

**Definition:** The ability of an electric device to beneficially support operation of the electric grid. **Antonym:** egonetic

1890 to 2010

Electricity on demand!

Customer commands; device gives

2020 to 2140

Electricity with  
Grid Requests  
..10010110... →

Customer inputs flexibility to device;  
device serves **customer 1<sup>st</sup>**, then grid!

# Water heater benefits as Flex Powerplant

- Expected peak demand benefits

- HPWH

- 0.18 kW load reduction;
    - 1.5 kWh as storage (twice a day)

- Resistance

- 0.35 kW load reduction;
    - 3 kWh as storage (twice a day)

- 24x7 ops reduces natural gas use at powerplants

- ~ 2.9 million Btu per water heater/year used as flex resource

# Daily control saves system energy

In 21<sup>st</sup> century, system energy savings more important than device efficiency

**Assume 3 kWh stored per tank on 344 days per year**

1. Daily Economic Dispatch on 180 days yields 1.1 mmBtu/year saved
2. Wind firming on 114 days yields 0.8 mmBtu saved
3. Sink excess renewables on 50 day yields 1.0 mmBtu saved

**2.9 mmBtu saved can generate >390 kWh at the meter**

Heat Rate during avg. daily peak 9,200

Night Heat Rate 7,100

VS.

Heat Rate during avg. daily peak 9,200

# Northwest potential

Credit: <http://www.publicdomainpictures.net/view-image.php?image=145778&picture=business-success>

- Market:
  - 3.5 million WH
- Likely benefits (adoption at 50%)
  - After fifteen years (0.3 kW per tank)
    - 500 MW resource ~ \$500 million
- Cost (customer adoption at 50%)
  - \$15 per tank + \$1 mil in engineering per manufacturer
  - \$60 per enrolled tank (comm device and recruitment)
  - Accumulated cost after 15 years = \$150 million (B/C = 3.0+)
- Daily storage benefit
  - ~ 2 kWh without mixing valve
  - 3,500 MWh at \$300/kWh = \$1.0 billion in value cf. to battery

# Open-in-cloud vs. open-at-device

Photo credit EPRI

- Open-in-the-cloud means home run to the device maker to interact with any 3<sup>rd</sup> party
- 3<sup>rd</sup> party needs legal agreements with every device maker to simplify customer experience.
- Open-at-device means customer is charge, and any architecture is possible

Vendor Vision

Consumer or  
Automation Vision

# Design affects customer experience

## Open-at-device; modular interface

- Supports grid control without using internet
- Supports participation without needing customers internet or passwords
- Supports easy use of 3<sup>rd</sup> party HEMS
- Future proof against 5G IoT architectures and business models
- Security fixes never involve device

## Open-in-cloud

- Requires 3<sup>rd</sup> parties, like DR aggregators of utilities, to have agreements with 50+ device makers
- In major disaster, loss of Internet means loss of in-home energy management
- More revenue opportunities for device maker
