How to accommodate the variability & intermittency of Distributed Energy Resources (DER)?

The Duck Bill

Challenge

Overvoltage

Unexpected capacity /
backfeed

Dynamic supply changes

Time of day/weather

Supply Demand Mismatch

Supply peaks midday
Evening is new peak
Quick ramp time

How to maintain safe,
reliable and affordable
service?

"In the near future, utilities may no longer just supply electricity to customers, but may have to plan for, coordinate, and manage the flow of energy to, from, and between customers."

Flexibility Inventory for Western Resource Planners

Andrew Mills and Joachim Seel

Energy Technologies Area

October 2015

As grid-connected solar and wind resources become more prevalent, fifteen-minute resources become more important for grid stability.

An Oct 2015 LBNL study concluded that batteries, demand response, and quick-start generators provide this service much more effectively than large, fossil-fueled power plants.

The flexibility of these options enables them to react quickly, and at full capacity, to imminent, short-term needs.

Conventional controls

Distributed controls

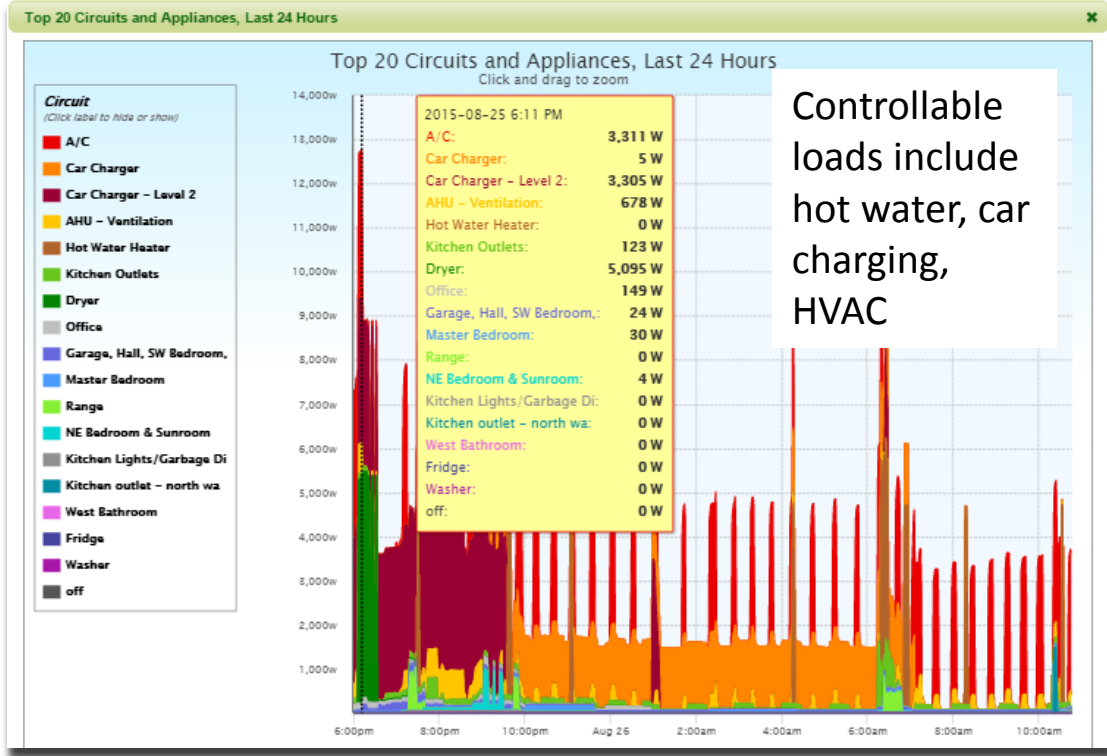

Traditional ICT model	Information Centric Networking (ICN)
Based on IP addressing.	Context aware communications.
Topology based.	Dynamic and flexible name resolution. Self-organizing.
IP addresses not persistent for mobile devices.	Secure binding between names and content instead of IP addresses to identify devices, data, users and services inherently more secure.
Vertical silo architecture. Vendor lock-in version 2.0	Unified, vendor-neutral, service oriented architecture.
Vendor specific APIs and ecosystems (Google Nest, Apple Homekit, Samsung SmartThings)	Standard APIs for system and device types, i.e. software defined buildings.
Broadcast, cloud centric	Content locality, local computing and caching, multicasting
