EE as a Resource

Energy Efficiency is the Pacific Northwest's Second-Largest Resource

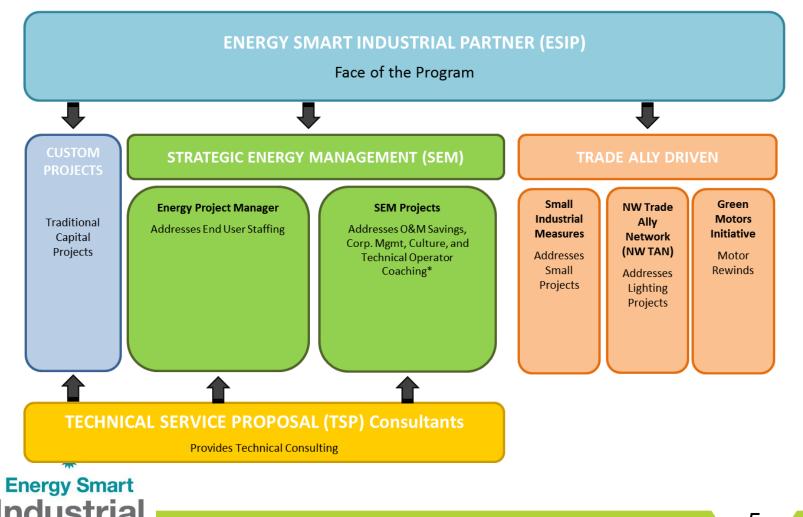

ESI Program Components

BPA ENERGY EFFICIENCY

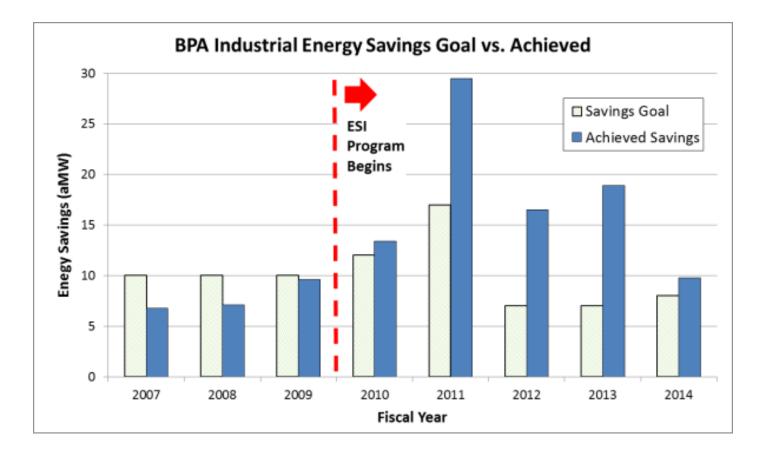

About Cascade

- BPA's ESI program partner since 2009
- Eight 'boots on the ground' Energy Smart Industrial Partners with backgrounds in:
 - Food Processing
 - High Tech Manufacturing
 - Pulp and Paper
- Two water/wastewater sector specialists

Energy Smart Industrial

BPA Pilots DR

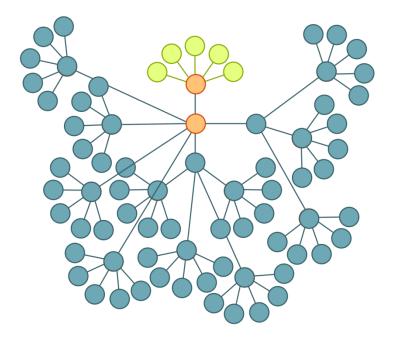

Demand Response Product

Purpose

Renewable Integration	Reduce reserved generation for highly variable renewable resources
Summer Peak	Reduce generation and transmission requirements during regional, three-day heat wave
Winter Peak	Reduce generation and transmission requirements during regional, three-day cold snap
Transmission Relief	Reduce peak transmission requirements on congested transmission lines

South Puget Sound SEM Cohort Year 5 Celebration

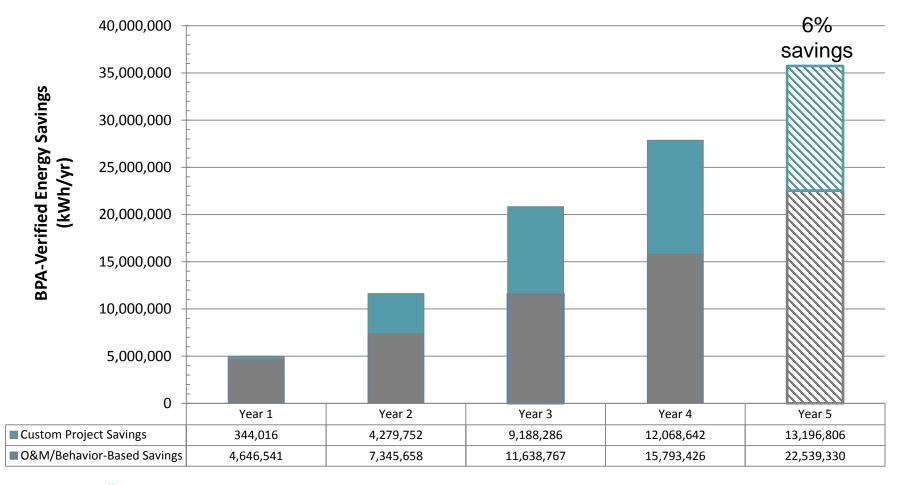

Verified Energy Savings

Verified Energy Savings

Three SEM + Demand Response Success Factors

Leadership

Management made quick, informed decisions to enroll in DR pilot.

Personnel

Energy Champions Empowered to implement. Trust program and recommendations.

Technical

Energy drivers known and metered. Installed control systems enable control of energy use.

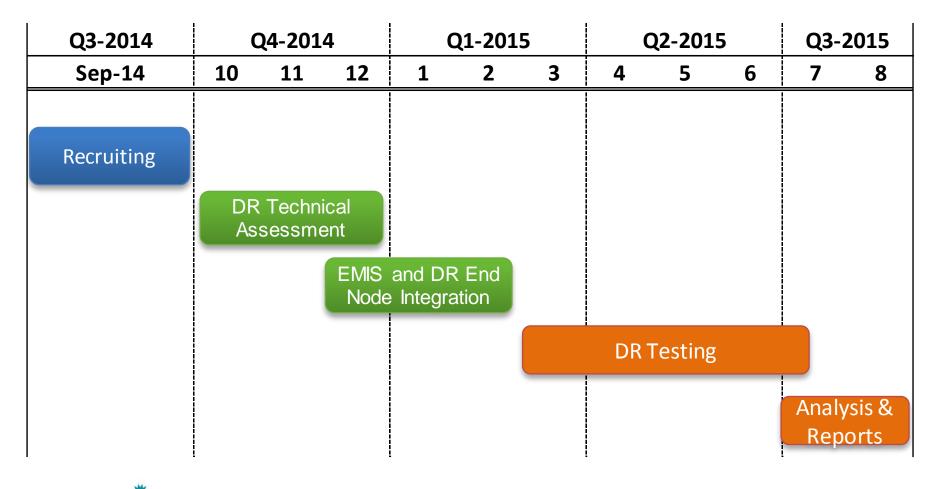

1st Lesson Learned

SEM and DR share common organizational and technical success factors. Program designs should be integrated.

EE-DR Pilot Timeline

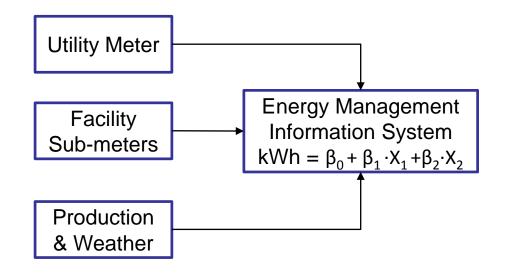

Description of Participants

SITE CHARACTERISTICS	MUNICIPAL WATER	COLD STORAGE	FOOD PROCESSING - CHILLED	FOOD PROCESSING - FROZEN
EE Engagement	SEM Year 2	SEM Year 1 Large Capital Project	SEM Year 2	SEM Year 2
DR Opportunities	Pumping Systems	Refrigeration & Battery Chargers	Production Scheduling Change	Refrigeration
Connected Load (average)	2,000 kW	300 kW	1,500 kW	4,000 kW

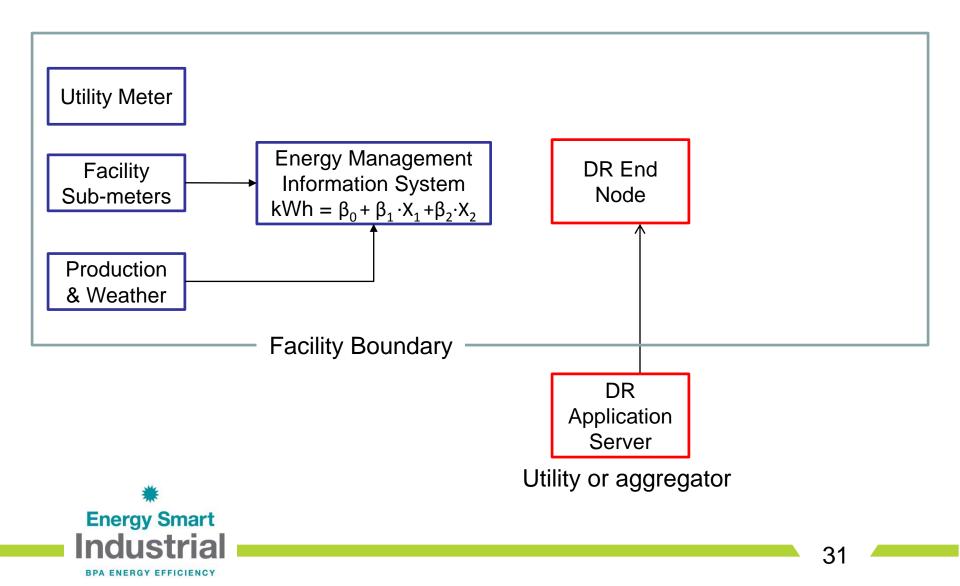

Core EMIS Requirements*

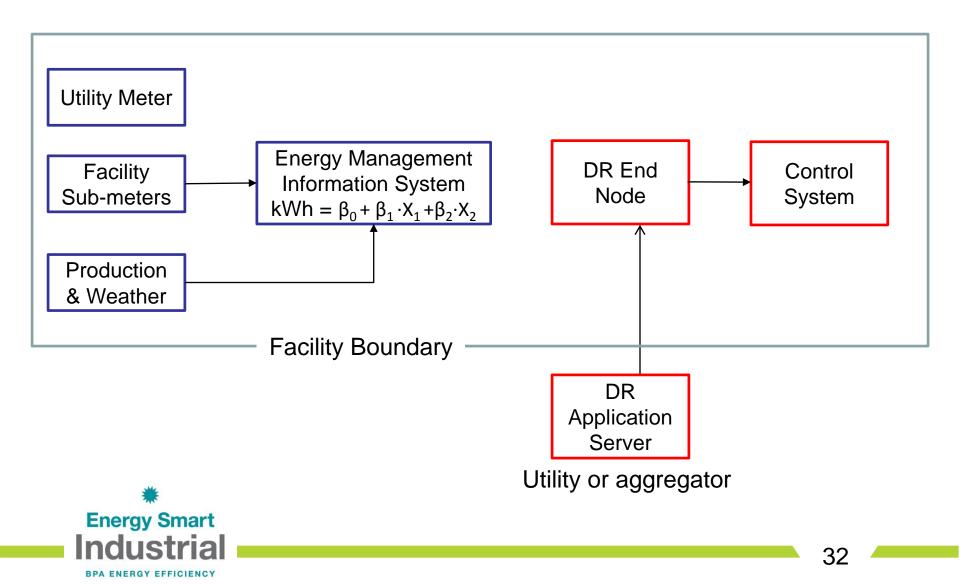

- The ability to quantify savings using a predictive model.
- The ability to incorporate production data into savings calculation.
- The ability to track energy data at a daily (or more granular)

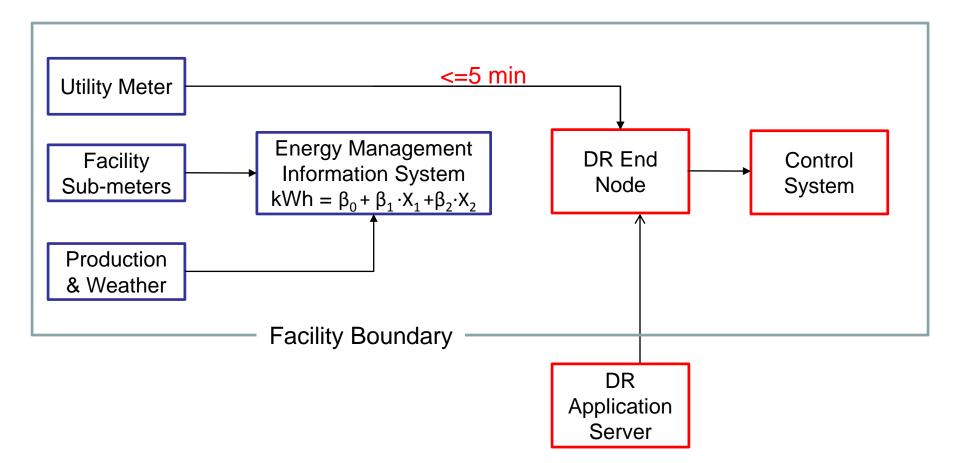

*Inventory of Industrial Energy Management Information Systems (EMIS) for M&V Applications, Northwest Energy Efficiency Alliance, June 2014.

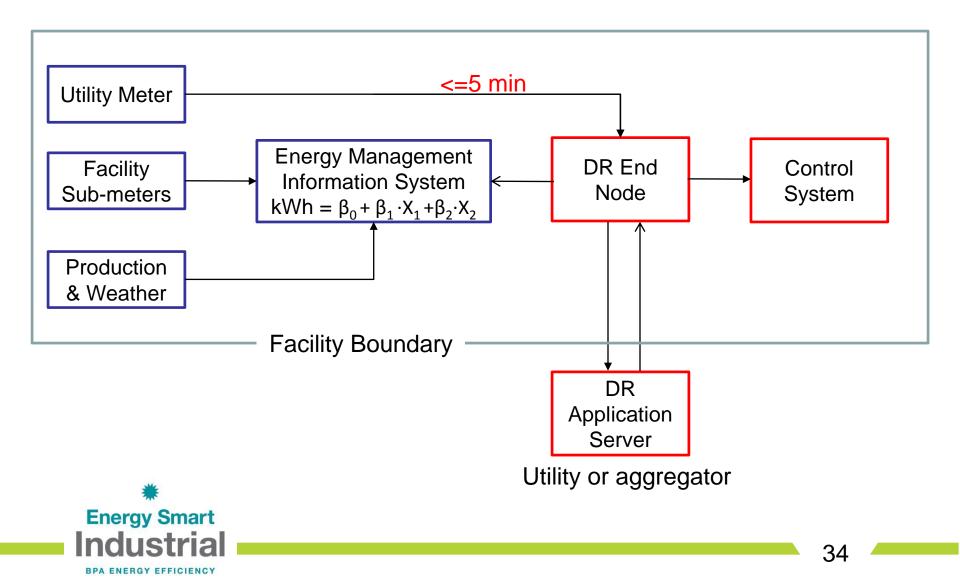

30

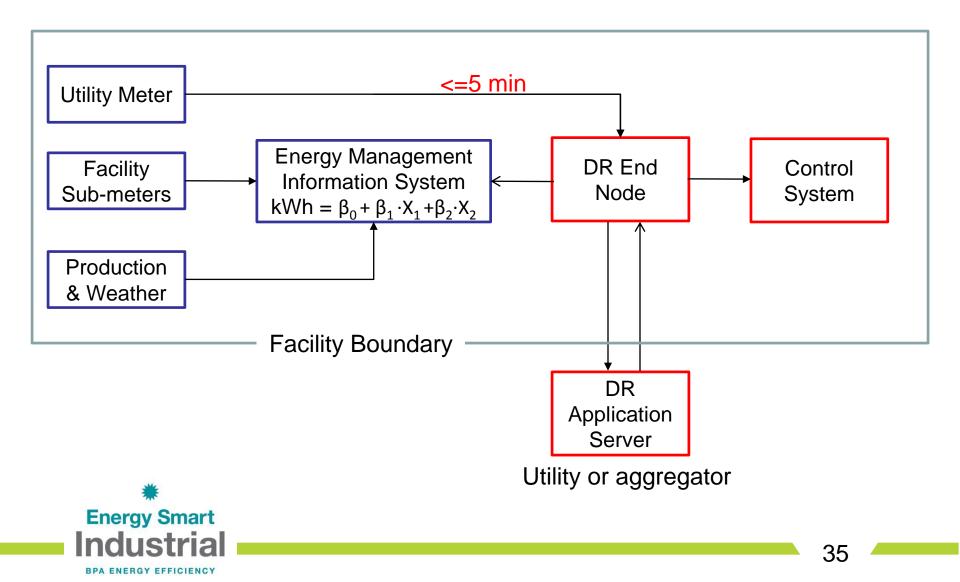

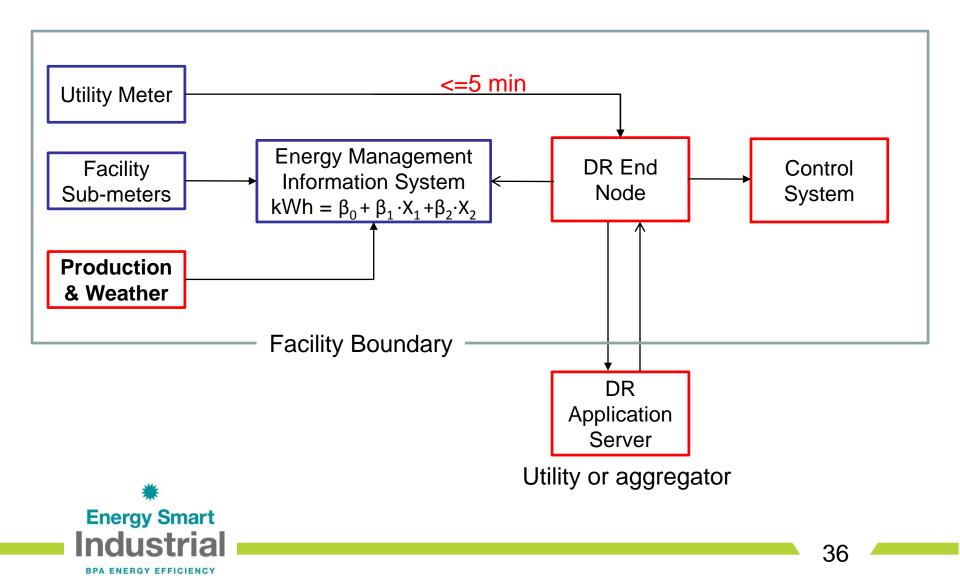

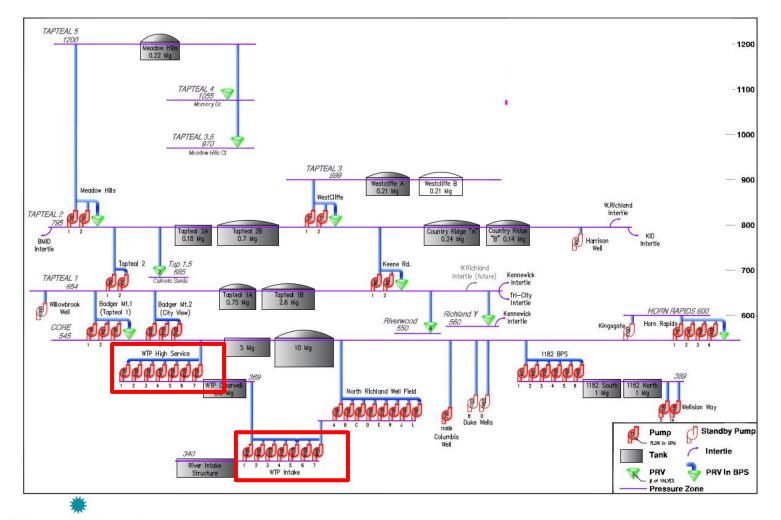

2nd Lesson Learned

Data requirements are similar. Integrated EMIS systems should include production data and energy models.

Water System – SEM Energy Map

Energy Smart ndustrial

Municipal Water System

Energy Storage

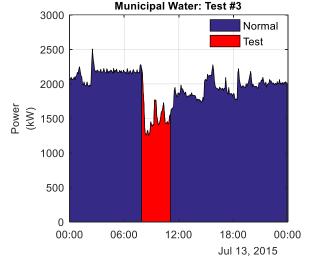

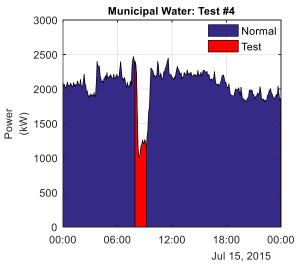

Dispatchable Load

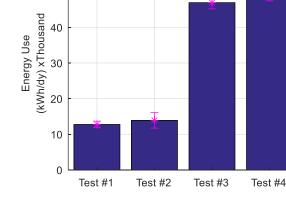

Municipal Water System

Opportunity – Large reservoirs can supply water demand while pumping is curtailed. **Testing** – Test events conducted during low and peak water demand. **Interaction** - DR event did not affect energy efficiency before or after the event.

Actual

Pred CI

60

50

Test #3 Curtailment 377 kW 3 hours

Test #4 Curtailment 714 kW 1.5 hours No impact on energy consumption on day of curtailment

Actual and Predicted Energy Use

40

3rd Lesson Learned

System knowledge gained from SEM enhances ability to troubleshoot and optimize DR performance

DR Product Criteria

Notification Window

Time between notification and event.

- Shorter windows reduce participation:
 - require automation
 - limit system preparation.

Duration

Length of time energy use is curtailed.

- Longer events reduce participation
 - Require more process storage

Availability

When the asset must be available.

- Industrial schedule must match criteria:
 - Time of Day
 - Days of Week
- Months of Year

Cold Storage Facility

Energy Storage

Dispatchable Load

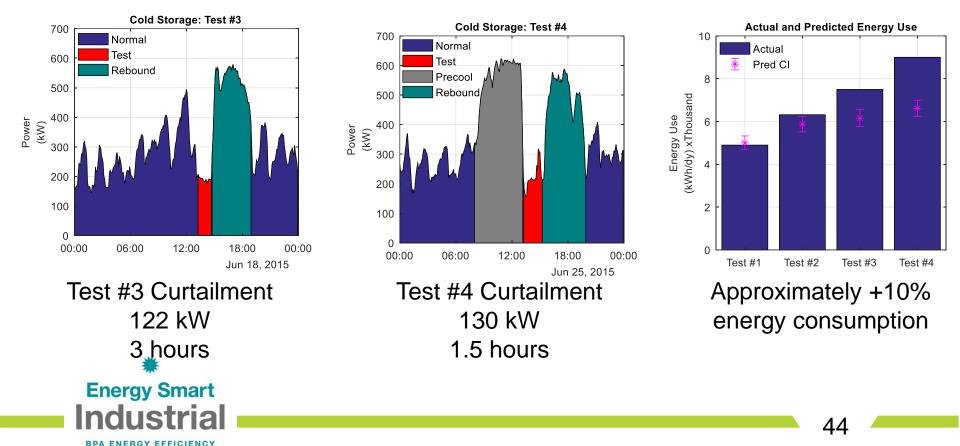

Cold Storage Facility

Opportunity – Sophisticated refrigeration controls (EE project) enabled fine-tuned system control

Testing – Test events conducted during spring and summer.

Interaction – "Pre-cool" needed for sustained curtailment. Increased energy consumption during prep and recovery.

4th Lesson Learned

Interactive effects are system and DR Product specific.

Results from other programs or sites can not be used to predict interactive effects.

Supporting Material

Common Program Elements

Program Element	SEM	DR
Energy Information	15 minute interval	<=5 minute interval
Measurement and Verification	Regression-based models (daily or weekly)	Regression-based models or 'similar day' methods (using production data)
Key Site Contact	Energy Champion	DR Champion
Implementation Strategies	O&M improvements Control systems SOP modification	Control Systems SOP modification

Summary of Demand Response Tests

	Test #	Municipal Water		Cold Storage		Food Chilled		Food Frozen	
		Season	Duration	Season	Duration	Season	Duration	Season	Duration
	1	Winter	Long	Spring	Short	Spring	Short	Spring	Spring
	2	Winter	Long	Spring	Short	Spring	Long	Spring	Spring
	3	Summer	Long	Summer	Short	Summer	Long	-	-
	4	Summer	Short	Summer	Long	-		-	-

Summary of Demand Response Tests

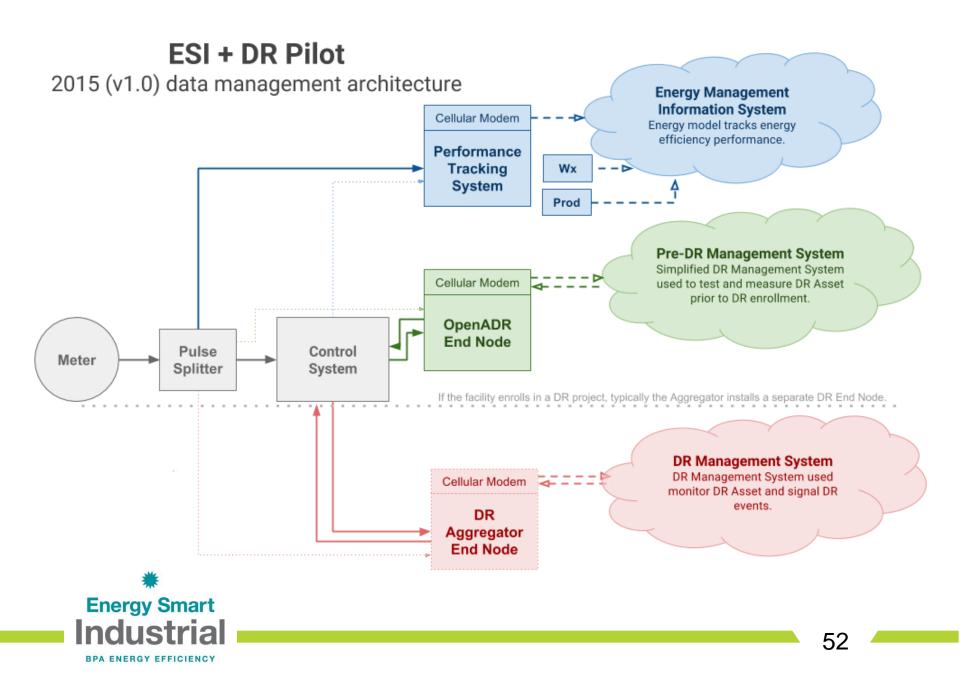

End-user	Test #	Season	Time Required to Curtail	Duration of Curtailment	Measured Curtailment	Impact on Energy Intensity
a	1	Winter	15 Min	3 hr	334 kW	None
Municipa Water	2	Winter	10 Min	3 hr	476 kW	None
un Ma	3	Summer	15 Min	3 hr	377 kW	None
2	4	Summer	15 Min	1 hr	714 kW	None
0	1	Spring	15 Min	1 hr 15 min	0 kW	None
Cold	2	Spring	15 Min	1 hr 5 min	11 kW	Increase
Cold Storage	3	Summer	15 Min	1 hr 30 min	122 kW	Increase
0,	4	Summer	10 Min	2 hr 15 min	130 kW	Increase
qq	1	Spring	2 hr	15 min	None	None
Food Chilled	2	Spring	2 hr	3 hr	None	None
Ċ Ľ	3	Summer	2 hr	3 hr	None	None
Food Frozen	1	Spring	20 Min	55 min	238 kW	None
Fc Fro	2	Spring	20 Min	1 hr 55 min	235 kW	None

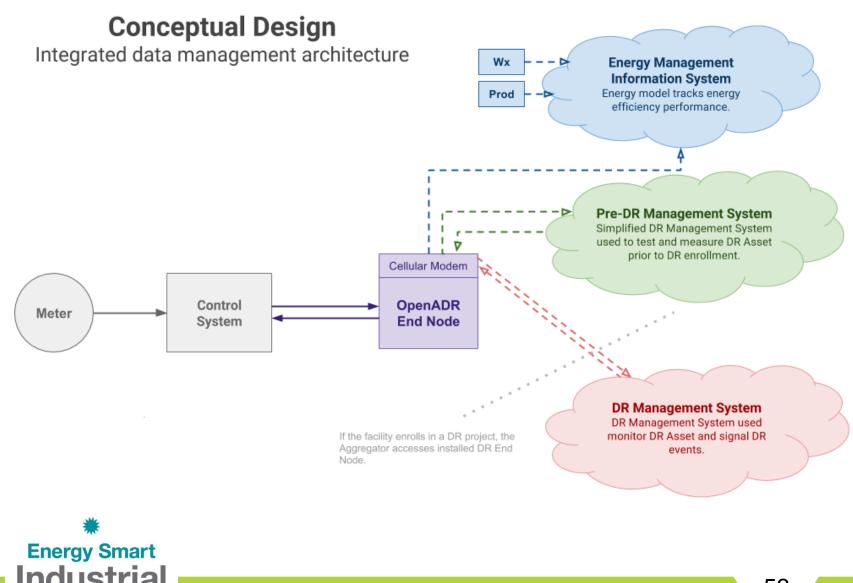

DR M&V Methodologies

Method	Baseline	Event
Observed	Minimum power measured within 2 hours of	Minimum power during sustained
Measured ¹	deployment	response
Similar Days ²	Average power for the hour of 10 similar days prior to the test	Average power for each hour during sustained response
Regression ³	Power estimated from regression model using temperature and/or production during test	Average power during sustained response
